Emergency Management Telecommunications **OUTREACH** 911[®]

Reliable, Portable, Affordable, High-Speed, Emergency Notification System

Just Pack It Up and Take It With You!

The new OutReach911 is built in two parts; a very ruggedized Geo-Coded laptop computer from Panasonic and a High Speed Telephony Server built by Intel. The laptop computer contains the maps, and Long/Lat coordinates for every contact number located in the OutReach911 Database. The Intel Server contains four T1 communication cards and performs all out-calling and IVR services for the system. Since the Laptop is completely mobile, it can be picked up and moved to any alternate location when the emergency operations center must be deactivated for natural or man created disasters. Just plug into any internet connection nationwide and you will have same access to your contact base as prior to the event. Since the laptop can operate great distances from its telephony server, the laptop can service municipalities

and smaller counties without the need for the expensive T1 lines on site as is the case with all previous out-calling art. This new OutReach911 technology is superior in all areas of notification technology as well as being easily affordable by small agencies and corporate entities.

- **Real Time Status On All Calling Transactions**
- **Special Needs Locations Displayed Graphically**
- **Portable and Mobile For EOC Evacuations**
- **Reliable Alternate Call Center Backup Systems**
- **"Nodally Networkable" for Enhanced Call Rates**

The OutReach911 Geo-Coded Mapping System provides friendly graphical geographic access to phone numbers, cell numbers, cell towers, FM towers, first responders, real time video clips, fire and other hazard lines, pipelines, power grids, flood plains, zoning, hazmat mapping and numerous other types and classes of data. EMTEL can integrate your data bases and customize your mapping systems.
